

Product Concept

A browser-based collaborative presentation platform and Chrome extension that integrates with meeting platforms like Google Meet, Zoom, and Microsoft Teams to make online presentations interactive, synchronized, and multiplayer.

Problem

Current online presentations have several issues:

- Presenter controls everything
 - Participants constantly say:
 - “next slide”
 - “previous slide”
 - Screen sharing lags and becomes blurry
 - Annotations are limited or messy
 - Presenter switching is inconvenient
 - Collaboration during meetings is poor
 - Users cannot independently explore slides
-

Solution

A collaborative presentation layer that works on top of existing meeting platforms.

Instead of traditional screen sharing:

- Presentation is uploaded to the platform
 - Slides are synchronized in real time
 - Team members can interact collaboratively
 - Annotations and controls are shared live
-

Core Features

Collaborative Slide Control

Authorized team members can:

- move slides
- request navigation
- co-present
- hand off control instantly

Real-Time Annotations

Participants can:

- draw
- highlight
- add notes
- use laser pointers
- mark directly on slides

All annotations sync live for everyone.

Personal View Mode

Participants can:

- zoom independently
- revisit previous slides
- inspect details
- resync to presenter anytime

without interrupting the main presentation.

Presenter Recovery

If presenter disconnects:

- another team member can instantly continue presentation
 - annotations and presentation state remain intact
-

Smart Overlay Integration

A Chrome extension injects:

- collaborative toolbar
- annotation controls
- slide navigation
- meeting utilities

directly into meeting platforms.
